

## Level 1 (Imitation)

Uganda usually experiences two seasons for growing crops, the wet and dry season. The wet season is the most suitable season for growing crops while, in the dry season, there is usually very little water in the soil and the soil temperature itself is usually very high but light is always enough hence, the dry season is not suitable for crop growing.

S2 students at ZCHS were discussing about seed germination and were wondering which environmental factors are really very essential in causing seeds to germinate. You have just covered the topic of growth and developments in plants and during one of the lessons, you watched a video of a man carrying out an investigation to find out the conditions necessary for seed germination to take place. These students have approached you for assistance.

Watch this video again as provided to you by your teacher. Follow the steps in the video and help these S2 learners to set up an investigation ~~to~~ into the factors / conditions necessary for seeds to germinate.
